OTHER SOURCE(S): CASREACT 131:44796
AB The preparation of 3,4,5-substituted 8-carboxamido-1,5-benzodiazepin-2-ones using a solid-phase synthetic method is described. 4-Fluoro-3-

nitrobenzoic acid is tethered to a solid support via the acid group. Aromatic substitution of the aryl fluoride with either an α- or β-substituted β-amino ester is carried out in the presence of DIEA in DMF. The reduction of the aryl nitro group is accomplished in the presence of $SnCl2 \cdot H2O$. Hydrolysis of the ester is carried out in the presence of a heterogeneous mixture of 1 N NaOH/THF (1:1). The resulting aniline acid is cyclized to form the benzodiazepinone skeleton with DIC and HOBt. Selective alkylation at the N-5 position of the benzodiazepinone is accomplished with alkyl halides in the presence of $K2CO3$ in acetone. The desired products are cleaved from solid supports and obtained in 46-98% isolated yields.

obtain CA references citing the substance. The substance formats must be cited first. The CA File predefined formats are:

ABS -- Abstract
APPS -- Application and Priority Information
BIB -- CA Accession Number, plus Bibliographic Data
CAN -- CA Accession Number
CBIB -- CA Accession Number, plus Bibliographic Data (compressed)
IND -- Index Data
IPC -- International Patent Classification
PATS -- PI, SO
STD -- BIB, IPC, and NCL

IABS -- ABS, indented, with text labels
IBIB -- BIB, indented, with text labels
ISTD -- STD format, indented

OBIB -------- AN, plus Bibliographic Data (original)
OIBIB ------- OBIB, indented with text labels

SBIB -------- BIB, no citations
SIBIB ------- IBIB, no citations

The ALL format gives FIDE BIB ABS IND RE, plus sequence data when it is available.
The MAX format is the same as ALL.
The IALL format is the same as ALL with BIB ABS and IND indented, with text labels.

L12 ANSWER 122 OF 122 CAPLUS COPYRIGHT 2004 ACS on STN
ACCESSION NUMBER: 1958:77247 CAPLUS
DOCUMENT NUMBER: 52:77247
ORIGINAL REFERENCE NO.: 52:13730b-i,13731a-i,13732a-c
TITLE: Cyclic oxo amines. III. Reactions of substituted 1,2,3, 4-tetrahydro-4-oxoquinolines and of 1,6-dioxojulolidines
AUTHOR(S): Ittyerah, P. I.; Mann, Frederick G.
CORPORATE SOURCE: Univ. Chem. Lab., Cambridge, UK
SOURCE: Journal of the Chemical Society, Abstracts (1958) 467-80
CODEN: JCSAAZ; ISSN: 0590-9791
DOCUMENT TYPE: Journal
LANGUAGE: Unavailable
OTHER SOURCE(S): CASREACT 52:77247
AB cf. C.A. 52, 5411c. Earlier studies of the reactions of the above 2 types of keto amines were extended. The structures of the derivs. formed by the action of p-ONC6H4NMe2 (I), by bromination, and by dehydrogenation were elucidated. The action of N2H4 and of HNO3 and the application of the Mannich and the Schmidt reaction were also investigated. The properties of 1,6-dioxoisojuloline (II) were of particular interest. 1,2,3,4-Tetrahydro-4-oxo-1-methylquinoline (III) (0.3 g.) and 0.3 g.

p-Me2NC6H4CHO (IV) in 15 cc. alc. containing 0.1 cc. piperidine refluxed 4 hrs. and cooled gave 0.2 g. 3-p-dimethylaminobenzylidene derivative (V), m. 145° (alc.), of III. The use of NaOH instead of piperidine gave only a sticky product in low yield. 1,2,3,4-Tetrahydro-4-oxo-1-phenylquinoline (VI) (0.3 g.) and 0.3 g. IV in alc. containing 0.2 cc. 10% aqueous NaOH refluxed 1 hr. and set aside overnight gave 0.4 g. 3-p-dimethylaminobenzylidene derivative (VII), m. 148-50° (Me2CO). The use of piperidine instead of NaOH gave only unchanged VI. I (0.3 g.) in 5 cc. alc. added dropwise to 0.3 g. III in 5 cc. alc. diluted with 2 cc. 10% NaOH at 60° gave 3-(p-dimethylaminoanilino)-1,4-dihydro-1-methyl-4-oxoquinoline, needles, m. 215° (alc.). A similar experiment with VI gave 75% 1-Ph analog, m. 175°. VI (0.7 g.), 0.5 g. 2-quinolinecarboxaldehyde, and 0.1 g. KOH in 15 cc. alc. refluxed 2 hrs. gave 1 g. 1-phenyl-3-(2-quinolylmethylene)-4-oxo derivative, m. 205°. III (1.6 g.) in 30 cc. CCl4 shaken 2 hrs. with 1.7 g. N-bromosuccinimide (VIII) gave 1.9 g. 6-bromo-1,2,3,4-tetrahydro-1-methyl-4-oxoquinoline (IX), m. 85° (alc.). IX refluxed 1 hr. in aqueous alc.-KOH gave unchanged material. IX treated with IV in alc. containing piperidine gave the orange 3-(p-dimethylaminobenzylidene) derivative, m. 165°. A similar experiment with I in alc. containing 10% NaOH gave the yellow 3-(p-Me2NC6H4NH) derivative, m. 281°. VI similarly treated gave the 6-Br derivative (X), m. 95-100° (alc.), unaffected by refluxing aqueous KOH. X gave the yellow 3-(p-Me2NC6H4NH) derivative, m. 210° (alc.). With 3.4 g. VIII and 5 mg. Bz2O2 shaken 4 hrs. and left overnight was obtained 2.8 g. of the 6,8-dibromo-1-methyl-4-oxo derivative (XI), m. 126°. XI gave the 3-(p-dimethylaminobenzylidene) product, plates, m. 190° (C6H6 or MeOH), and a yellow 3-(p-Me2NC6H4NH) derivative, m. 225°. III (1 g.), 0.1 g. 10% Pd-C, and 10 cc. (CH2OH)2 refluxed 0.5 hr. and the product treated with picric acid gave the picrate (XII) of 1,4-dihydro-1-methyl-4-oxyquinoline, m. 226°. Repeating the above experiment but using X gave XII. Similarly, VI gave the picrate of the 1-Ph derivative, m. 136° (alc.). III (0.8 g.) 0.6 g. Me2NH.HCl, 0.2 g. paraformaldehyde, and 15 cc. Me2CHCH2CH2OH refluxed 15 min. and the clear solution treated with 0.3 g. more aldehyde and refluxed a further 0.5 hr. gave 0.8 g. 1,4-dihydro-1,3-dimethyl-4-oxoquinoline, m. 320° (decomposition), sparingly soluble in hot alc., Me2CO, and C6H6. Repetition of this experiment but using 1.1 g. VI gave 1 g. 1,4-dihydro-3-methyl-4-oxo-1-phenylquinoline (XIII), darkened at 295° and slowly decomposed at 320-40°, but immersed at 310° it m. 325°. Thus the initial product in this reaction is the tertiary amine-HCl, which breaks off the dialkylamine-HCl to form the 3-methylene derivative, which then isomerizes to the stable XIII. III (0.8 g.) and 0.12 g. pure N2H4.H2O in 10 cc. alc. containing 0.1 cc. AcOH refluxed 1 hr. gave 0.75 g. N,N'-bis(1,2,3,4-tetrahydro-1-methyl-4-quinolylidene)azine (XIV), plates, m. 198° (C6H6). VI in the above experiment gave 73% of the 1-Ph analog, m. 208° (dioxane). XIV in alc. added to a large excess of alc. picric acid deposited the monopicrate, red needles, m. 165° (decomposition). XIV in alc. chilled to 0° and treated with dry HCl gave the red HCl salt. A portion of the red solution treated, before separation of the red crystals, dropwise with cold concentrated HCl gave N2H4.2HCl, m. 198-200°. Alternatively, a fine suspension of XIV in Et2O similarly treated with HCl gave the HCl salt, m. 85-7°; analysis indicated that this was a di-HCl salt. HCl passed 0.5 hr. through molten XIV, initially at 200° and then at 190-200°, gave the di-HCl salt of s-bis(1,2-dihydro-1-methyl-4-quinolyl)hydrazine, m. 295° (decomposition); dipicrate, m. 243° (decomposition) (alc.). Concentrated H2SO4 (8 cc.) added dropwise to 1.6 g. III in 10 cc. CHCl3, the solution stirred a

further 15 min., diluted with 45 cc. cold H2O, neutralized, and extracted with Et2O gave 1 g. β-[N-(o-aminophenyl)-N-methylamino]propionic lactam, needles, m. 170° (C6H6). VI similarly treated gave 91% β-[N-(o-aminophenyl)anilino]propionic lactam, m. 221° (alc. then C6H6). III (1 g.) in 10 cc. AcOH treated below 15° with a mixture of 1 cc. concentrated HNO3 and 10 cc. AcOH, set aside 20 min., and poured into H2O gave 1.2 g. 6-nitro derivative, needles, m. 169° (alc.); phenylhydrazone, red plates, m. 198° (decomposition) (alc.); 3-(p-dimethylaminobenzylidene) derivative, red plates, m. 210° (alc.). p-ClC6H4NH2 on cyanoethylation gave a low yield of p-ClC6H4N(CH2CH2CN)2, which in turn on cyclization gave a small amount of 8-chloro-1,6-dioxojulolidine (XIVa). This difficulty also applies to the Br analog, but p-BrC6H4N(CH2CH2CN)2 (XV) and 8-bromo-1,6-dioxojulolidine (XVa) can be readily prepared by direct bromination with IX. p-BrC6H4NH2 (17 g.), 12 g. CH2:CHCN, 12 g. AcOH, and 1.7 g. CuCl refluxed 12 hrs. and poured into 100 cc. NH3 gave p-BrC6H4NHCH2CH2CN, b5 160°, m. 96-8°; the residue in the flask decomposed at higher temps. This experiment when repeated by refluxing 20 hrs. gave 2 g. above compound and 4 g. XV, m. 94-5° (alc.). PhN(CH2CH2CN)2 treated 4 hrs. in CCl4 with 1 mole IX and 0.05 mole Bz2O2 gave 82% XV. XV heated with AlCl3 in PhCl gave what was apparently 1-(2-cyanoethyl)-1,2,3,4-tetrahydro-4-oxoquinoline, m. 79-81°; phenylhydrazone, m. 250°; 2,4-dinitrophenylhydrazone, m. above 360°. Thus under the conditions used for this monocyclization the nuclear Br was removed. II, 0.6 g. 2-quinolinecarboxaldehyde, 15 cc. alc., and 0.1 g. KOH refluxed 1 hr. gave 0.3 g. 1,6-dioxo-2,5-bis(2-quinolylmethylene)julodidine, m. 185° (C6H6). The 7,9-di-Me derivative (XVI) of II similarly treated gave the 7,9-di-Me homolog, m. 225° (C6H6). XVI treated with 2.2 moles IV in refluxing alkali and alc. gave 93% 2,5-bis(p-dimethylaminobenzylidene)-7,9-dimethyl-1,6-dioxojulolidine, needles, m. 245° (alc.). XVI similarly treated with 2.1 g. I gave 83% 2-(p-dimethylaminoanilino)-5-)p-dimethylaminophenylimino)-7,9-dimethyl-1,6-dioxojulolidine (XVII), purple crystals, m. 268° (decomposition) (Me2CO). XVII (0.5 g.) refluxed 0.5 hr. with 20 cc. concentrated HCl gave 1.25 g. 7,9-dimethyl-1,2,5,6-tetraoxojulolidine (XVIII), bronze-colored crystals, slowly decomposed at 330°. XVIII resembles the parent member in that it is insol. in all the usual solvents, but soluble in aqueous KOH to give a purple solution It did not condense with p-C6H4(NH2)2. IX (2 g.) and 0.05 g. Bz2O2 shaken 3 hrs. with 1 g. II in CCl4 gave 1.2 g. XVa, plates, m. 208°, λ 421.5-25.5, 301-2.5, 227, 338.5-40, and 276.5 mμ, ε 5130, 4490, 30,100, 252, and 1650. When the mixture was refluxed only a brown amorphous intractable material was obtained. XVa gave a bis(phenylhydrazone), m. 270°. XVa (0.28 g.) and 0.22 g. BzH in 15 cc. alc. and 0.1 cc. piperidine refluxed gave 0.2 g. 2,5-dibenzylidene-8-bromo-1,6-dioxojulolidine, m. 200° (alc.). II treated with I mole N-chlorosuccinimide under the above conditions at room temperature gave no reaction, but warming the mixture under reflux 1 hr. gave 68% XIVa, m. 201°. II (1 g.), 0.1 g. 10% Pd-C, and 25 cc. p-cymene refluxed 1.5 hrs., a slow stream of CO2 blown through the solution, and the hot mixture filtered and cooled gave 0.6 g. 1,6-dioxoisojuloline (XIX), m. 202° (lower yields were obtained in expts. on a larger scale); HBr salt, m. 270° (decomposition); picrate, m. 202°; diperchlorate, m. 240° (decomposition). A cold aqueous suspension of this salt with NH4OH gave XIX. An alc. solution of the salt treated overnight at 0° with excess HClO4 gave the normal perchlorate, m. 125°, and these crystals dissolved in hot alc. gave the diperchlorate on cooling; metho-p-toluenesulfonate, m. 180° (decomposition); phenylhydrazone-0.5H2O, plates, m. 220°. 2-(p-Dimethylaminobenzylidene)-1,6-dioxoisojulolidine prepared in refluxing alc. with piperidine formed red

crystals, m. 230° (dioxane). Although the conditions of the above reduction were varied over wide limits no further dehydrogenation could be effected. XIX (0.33 g.), 0.22 g. CH2(CN)2, 0.1 g. NH4OAc, 10 cc. C6H6, and 1 cc. AcOH refluxed 45 min. gave 1-(dicyanomethylene)-6-oxoisojulolidine, needles, m. 245° (decomposition). Attempted application of the Mannich reaction to II under the above conditions gave solely an intractable powder of indefinite m.p. II (2 moles), 1 mole N2H4.H2O, and a few drops of AcOH on heating gave a complex orange polymeric mixture, m. 280-320°. II gave a deep yellow mixture XVI (1 g.), 1 g. 100% N2H4.H2O, 0.5 g. KOH, and (CH2OH)2 refluxed 2 hrs., heated 4 hrs. at 195-200°, the mixture diluted with H2O, cooled, the solids collected, extracted with alc., and the exts. evaporated gave with picric acid a picrate, almost certainly julolidine picrate. XVI similarly treated gave the 7,9-dimethyljulolidine picrate, m. 160° (alc.). II in CHCl3 with H2SO4 and NaN3 gave 81% dilactam of 2,6-diamino-N,N-bis(2-carboxyethyl)aniline, plates, m. 356° (decomposition) (AcOH). 7-Methyl-1,6-dioxojulolidine (2.1 g.), 3.1 g. isatin, and 3.6 g. KOH in 25 cc. MeOH and 5 cc. H2O refluxed 20 hrs. gave 3 g. 7-methyl-6-oxoquinolino(2',3'-1,2)juloline-4'-carboxylic acid (XX), m. 215° (decomposition). XX heated in a tube at 210-20°/0.1 mm. underwent decarboxylation and gave 7-methyl-6-oxoquinolino(2',3'-1,2)juloline, plates, m. 185°, unchanged by further crystallization or sublimation. II (1 g.) in 10 cc. AcOH treated with 1 cc. concentrated HNO3 below 20° and set aside 20 min. gave 1.2 g. 8-nitro-1,6-dioxojulolidine, m. 250°; bis(phenylhydrazone), m. 270° (decomposition).
